(54) Title: SHOE WITH UPPER AND HEEL DEVELOPED VENTILATION

(57) Abstract: The present invention relates to shoe construction to alleviate perspiration of user's feet and to get a more comfortable walking: inner ventilation air is obtained mainly both by using a suitable special shaped inner foamed oversole, with interconnected open chambers, porous cushioned, memory retentent, with one or more hollows 6 and 8 fig. 1, under the footsole, in combination with a rear heel inner protrusion 11 as a pump in addition to air ventilation got by said hollows. Said air is drawn into and expelled from some intakes and outlets fitted in the rear heel portion, that can be partially or totally clogged by some straps 13 fig.5 with buttons 14. To increase ventilation and to get it more homogeneous, in combination with pumping effect of said oversole with hollows, the higher upper portions are provided with some protrusions 5 and 5' fig.3 that surmount lower upper portions, where some holes for air passage are fitted. With suitable sewing lines 7 and 7' fig.3 which connect both upper portions, leaving open some low sides 9 and 9' of said protrusions, as air conduits, a satisfactory waterproofing to the rain is effected.

For two-letter codes and other abbreviations, refer to the "Guidance Notes on Codes and Abbreviations" appearing at the beginning of each regular issue of the PCT Gazette.
